

ABSTRACT OF DISCLOSURE

A method and apparatus generating a device driver and a user interface screen for the device driver. The method of generating a device driver having a plurality of functional components includes generating a file for each functional component of a device driver and a user interface; when a modification of a functional component is needed, rebuilding only a file corresponding to the functional component to be modified to make a device driver installation program; and reconstructing device driver information using a file corresponding to a functional component selected by a user on the device driver installation program and generating a device driver using the reconstructed device driver information.
